"Selection of Optimum Heat-Treating Conditions."

in book - Improving the Quality of Steel Castings; Transaction of the All-Union Conference, Moscow, Mashgiz, 1958. 214 p.

The following are investigated for their effect on the mechanical properties and microstructure of steel castings. 1) low temperature annealing and Normalization 2) higher-temperature annealing and normalization, with holding at temperature for various periods of time 3) rate of cooling. In addition, the effect of heat-treating conditions on the plastic properties of steel is studied.

TITLE: Analysis of radiation injury to deoxyribonucleoproteins at the molecular and supramolecular levels

SOURCE: AN SSSR. Izvestiya. Seriya biologicheskaya, no. 2, 1966, 197-210

TOPIC TAGS: radiation injury, protein, DNA, x ray irradiation, hydrogen bonding, molecular structure

ABSTRACT: X-irradiation does not give rise to covalent crosslinks within the DNA macromolecule, i.e., it does not prevent the separation of DNA strands or interfere with its replication. The authors' studies on optic rotation of DNA and DNP and melting curves indicate that irradiation causes latent damage to the system of hydrogen bonds. The formation of single breaks in the polynucleotide skeleton may result in rotation around the remaining single bond at the site of the break. This may produce local change in the configuration of the DNA macromolecule, resulting in steric hindrance between the DNA and corresponding protein molecule.

Irradiation with doses below  $10^3$  rad causes breaks only in a small number of DNA molecules. This does not alter the physicochemical properties of the DNA or DNP as a whole, although it undoubtedly has some biological

Card 1/2

UDC: 577.391

L 31194-66

ACC NR: AP6022568

effect. Thus, there is no reason to believe that the effects of low irradiation doses, as manifested in structural rearrangements of chromosomes, are related to changes in the DNA macromolecules. The results of studies on the physicochemical properties of supramolecular oriented DNP structures present in a medium with physiological ionic strength indicate that these formations are highly sensitive to radiation. Title : Physiological Characteristics of the Wheat Leaf Upon  
the Application of Granular Phosphate and Azotobacterin.

Orig Pub : Tr. Omskogo s.-kh. in-ta, 1957, 22, No 1, 3-6

Abstract : The seeds of Mil'tarum 290 wheat treated with azotobacterin were mixed with granulated fertilizers prior to planting. The viscosity of the plasma became noticeably higher upon application of granulated fertilizers. An addition to them of azotobacterin increased the effect. The resistance of the plasma colloids to high temperatures obeys the same rule. Similar results were obtained by the determination of photosynthesis and water balance

of the leaves. Observations were conducted during the tiling stage at the temperature of 24.5° and with the humidity deficiency of perhaps 10.4. If the true productivity of the leaves in grams (per 1 square meter x 1 24-hour period) on the control was 3.57 and the loss of water by the leaves in three hours comprised 627.38 milligrams/square inch, then upon application of organic and mineral fertilizer plus azotobacteria, the same indicators were expressed by figures 5.45 and 510.36 respectively. The result of this is an increase in the yield from 13 to 21 centners/ha. -- Ye.A. Yablonskiy

TITLE: A method for bending sectional profiles from sheet stock. Class 7, No. 185827

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 21

TOPIC TAGS: sheet metal, metal bending, bending machine

ABSTRACT: This Author's Certificate introduces a method for bending sectional profiles from sheet stock. Cross sections with internal bending radii close to zero are produced from material with low ductility by additional bending with the application of compressive force to shelves on the prebent profile along lines which are normal and tangent to the central axis of the cross section.

TITLE: High boron chromium-nickel-tungsten-molybdenum steel brand EPh00

SOURCE: ~~415, 27~~ ~~415, 27~~ ~~415, 27~~ ~~415, 27~~ ~~415, 27~~  
Teploenergetika, no. 11, 1965, 70-74 A

TOPIC TAGS: boron containing alloy, chromium containing alloy, nickel containing alloy, tungsten containing alloy, molybdenum containing alloy, solid mechanical property, metal tube, steel/steel EPh00

ABSTRACT: The article starts with a review of past work in the Soviet Union on the suitability of alloys of this type for steam tubes. A series of curves shows the effect of boron additions on hot ductility and deformation resistance. The present tests were made on chromium-nickel-tungsten-molybdenum steel Brand EPh00, but containing approximately 0.4% boron. The metal for the tests was taken from two industrial melts made in an electric furnace. The chemical composition of these melts was as follows (%): carbon-0.10, 0.09; silicon-0.30, 0.26; manganese-1.49, 1.51; chromium-16.40, 16.28; nickel-19.20, 19.08; E

tungsten-2.54, 2.47; niobium-1.22, 1.21; boron-0.36, 0.40; cerium (calculated)- less than 0.02; sulfur-0.008, 0.009; and, phosphorous-0.005, 0.005. The article gives curves illustrating the following properties of the steel under investigation: the effect of heating temperature and cooling rate on the change in hardness and the grain size; the effect of boron content on change in hardness as a function of heating temperature; the change in the mechanical properties as a function of the experimental temperature and heat treatment conditions; the effect of boron content on the change in the mechanical properties as a function of the experimental temperature; and, the effect of boron content on the change in the elongation strength limit. Also shown are photos of the microstructure of the samples after various treatments. The article concludes that the lowered ductility of steel EP400 (0.4% boron) in the temperature interval of hot plastic deformation makes it difficult to fabricate into tubes. The test results also indicate tendencies toward boride liquation and toward lowered plastic properties and shock viscosity which cannot be raised by subsequent heat treatment. In addition, recent tests on this steel by other authors indicate that the high boron content promotes the appearance of hot fracturing and increases its tendency toward cold fracturing. It is therefore concluded that this steel is not suitable for fabrication of steam tubes.

AUTHOR: Kalikova, N. F.

TITLE: Behavior of indium in the oxidation zone of some polymetallic deposits of the Eastern Transbaikal

PERIODICAL: Geokhimiya, no. 7, 1962, 610 - 616

TEXT: The ore deposits of the Nerchinskiy Zavod and Klichka were studied. Their oxidation zone, which consists of lead and zinc carbonates and limonite at Nerchinskiy Zavod), and iron and manganese hydroxides at Klichka, is approximately 100 m deep. The indium content of its minerals was determined. It was found that indium becomes highly dispersed on oxidation and only accumulates in a few minerals. When a high-indium zinc blende (0.01 - 0.5%) oxidizes, the indium only accumulates in sauconite (0.0015%), while smithsonite and hemimorphite contain practically none. On boulangerite oxidation, indium accumulates in bindheimite (0.01 - 0.03%) due to formation of the complex  $InAsO_4 \cdot H_2O$  which precipitates at a pH of 3 to 3.5. Up to 0.03% indium was found in some other deposits. Iron and man-

gentic hydroxides have practically none, owing to the coprecipitation of indium and iron, which is less probable with aluminum or manganese. There are 12 tables.

TITLE: The effects of small concentrations of carbon monoxide on the human  
organism in airtight cabins of passenger aircraft

SOURCE: Konferentsiya po aviatsionnoy i kosmicheskoy meditsine, 1963.  
Aviatsionnaya i kosmicheskaya meditsina (Aviation and space medicine); materialy  
konferentsii. Moscow, 1963, 134-135

TOPIC TAGS: carbon monoxide effect, pressure chamber, man, higher nervous  
activity, passenger aircraft

ABSTRACT: In order to study the effects of small concentrations of carbon monox-  
ide, experiments were performed on 82 persons in pressure chambers and 185 persons  
in aircraft. Experiments have shown that after 3 hours, the presence of carbon  
monoxide in concentrations of 0.01 mg/l and higher causes certain negative shifts  
in the functional condition of a number of organs and systems. In the area of  
higher nervous activity, it was found that the presence of carbon monoxide resulted

Card 1/2

ACCESSION NR: AT4042669

in a lowering of the ability to differentiate, a decrease in memory, a shortening of the attention span, and an increase in the time for carrying out assigned tasks. In the area of visual and vestibular analyzers, it caused an increase in the latent period, a diminution in the retention of the afterimage, and a diminution in the time of counter rotation illusion. In the metabolic processes, it caused changes in body temperature. In the cardiovascular system, it caused changes in arterial pressure, changes in the functions of the cardiac muscle, etc. It caused a weakening of the muscles. It caused formation of carboxyhemoglobin in the blood and other changes in the composition of blood elements. On the basis of these data, it is suggested that 0.01 mg/l of carbon monoxide be established as the maximum allowable in the cabins of passenger aircraft.

TITLE

Angular Distribution of Photofission Fragments from Uranium.  
(Uglovoye raspredeleniye oskolkov pri fotodelenii urana - Russian)

PERIODICAL

Zhurnal Eksperim. i Teoret.Fiziki, 1957, Vol 33, Nr 7, pp 53-55 (U.S.S.R.)

ABSTRACT

With the help of Ilford D-1 plates saturated with uranium the angular distribution of the fission fragments are determined on the occasion of the fissioning of uranium by a  $\gamma$  bombardment with an energy of 9,4, 12, and 26,5 MeV. The 30 McV synchrotron of the FIAN served as a  $\gamma$  source.

Anisotropy increases very considerably with decreasing  $\gamma$ -energy. For the 3 coefficients, a, b, c, of the function of angular distribution the following values were determined:

$E_{\gamma}^{\text{max}}$	b/a	ratio between the anisotropic and isotropic fission yields
9,4	$0,55 \pm 0,09$	$0,55 \pm 0,09$ 1)
12	$0,20 \pm 0,07$	$0,13 \pm 0,05$
26,4	$0,07 \pm 0,06$	$0,05 \pm 0,04$

1)  $(\frac{2}{3} \cdot \frac{b}{a} + \frac{2}{15} \cdot \frac{c}{a})$  (2 tables, 1 ill., 3 Slavic references).

21(6) **TABLE I BOOK EXPLANATIONS** 807/2001

International Conference on the Peaceful Uses of Atomic Energy, 24. Geneva, 1958  
 (Nuclear Physics) Moscow, Atomizdat, 1959. 529 p. (Series: Nauka, Vol. 1)

Ms. (Title page): A.I. Alkhimov, Academician; V.I. Veksler, Academician; and  
 V.A. Maslov, Candidate of Physical and Mathematical Sciences; M. of this  
 volume: G.I. Buzdakov, V.I. Zaslavskiy, Candidate of Physical and Mathematical  
 Sciences; M. (Circle book): G.I. Maslov; Book: M. V.I. Maslov.

**NOTES:** This collection of articles is intended for scientific research workers  
 and other persons interested in nuclear physics. The volume contains 13 papers  
 presented by Soviet scientists at the 8th International Conference on Peaceful Uses of  
 Atomic Energy, held in Geneva in September 1958.

**CONTENTS:** It is divided into two parts. Part I contains 17 papers dealing with  
 plasma physics and controlled thermonuclear reactions, and Part II contains 26  
 scientific papers, including problems of particle identification and of  
 Soviet work on controlled thermonuclear reactions. The remaining papers in  
 Part I deal with particular problems in this field.

The papers in Part II deal in detail with various problems in nuclear physics,  
 such as the fission of heavy atoms and their isotopes, and with the study of  
 cosmic radiation by means of artificial earth satellites and rockets carried  
 in a paper by A.S. Khazov. The Russian-language edition of the proceedings  
 in the series is published in 16 volumes. The first 6 volumes contain all the  
 articles presented by Soviet scientists as follows: Volume (1), *Yadrovaia energiya*  
 (Nuclear Energy); Volume (2), *Yadrovaia fizika* (Nuclear Physics); Volume (3),  
*Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (4), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (5), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (6), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (7), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (8), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (9), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (10), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (11), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (12), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (13), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (14), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (15), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (16), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy);  
 Volume (17), *Yadrovaia fizika i yadrovaia energiya* (Nuclear Physics and Nuclear Energy).
